Excerpt: .having the acceleration-centre as centre. 19. Find the points of the body for which the acceleration normal to the path described by the point is zero. Take the centre of rotation as origin of f ; any point is describing a circle round it; hence the line joining the origin to 71 is the normal to the path of the latter; and if N be the normal acceleration, and r the distance from the instantaneous centre of rotation, Hence, at any instant, the points for which $N = 0$ lie on the circle? $+ - = SV$. This circle passes through the instantaneous centre of rotation, touches the curve G , and has a radius $= R$. For the reason stated in Ex. 21 it is called the circle of inflexions.--Differential Calculus, Art. 290. 20. Determine the points of the system for which the acceleration along the path is zero. They lie on a circle whose equation, referred to the centre of rotation as origin, is $(+ 1,) + -, .B = 0$. This circle passes through the instantaneous centre of rotation and cuts the curve C orthogonally. The theorems of the last two examples are due to Bresse (Journal de Vecole poly technique, t. xx.). 21. Determine at any instant the points of the body which are passing over points of inflexion on their respective paths. v2 They are the points having no normal acceleration (Ex. 19); for, as--is f then zero, and v not...
